mobile phone: +359888884022

This Starter Kit for NSIs is intended as an introduction to web scraping for on-line based enterprise characteristics (OBECs). The WPC team hope that it will support producers of official statistics with implementing their own web scraping routines to derive OBECs. However, the methods and functions in this Starter Kit most likely need to be adapted to the individual needs and particularities in the respective countries.

The Starter Kit has (so far) three parts:

- URLsFinder: A library to identify enterprise URLs with the search engine Duck Duck Go.
- URLScraper: Functions to scrape a list of URLs and safe the HTML code in a NoSQL database for later analysis.
- SocialMediaProfiles: A library to identify social media links on enterprise websites.

Each part of the Starter Kit has a Jupyter Notebook (file with .ipynb extension) that serves as a manual on how to use the functions and methods. These manuals are intended for statisticians with little to no programming background and can be viewed on this website. The source code can be consulted by users with a background in programming.

All other details and explanations you can find when you start to reading the Starter Kit for NSIs, V.1 on the following link: https://github.com/EnterpriseCharacteristicsESSnetBigData/StarterKit
